

Maximise value with Powerwall and Time-Based Control

Store excess energy produced by your solar system and access clean energy, day or night with Powerwall.

Use the Tesla app to set your electricity tariff so Time-Based Control can maximise the savings your energy system generates.

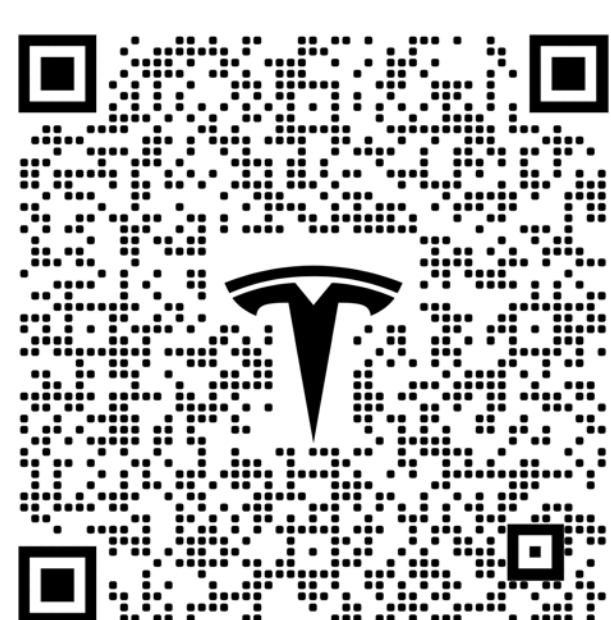

Time-Based Control uses your tariff to optimise when your Powerwall charges and discharges. Following your time-of-use tariff, Powerwall can automatically charge from the grid when electricity is cheap and discharge to the grid when electricity prices are high.

Depending on your tariff, enabling Time-Based Control can lead to an extra 40% reduction in your annual electricity bill, on top of your current yearly savings.

When there is less sunshine, combining Time-Based Control with a time of use tariff helps optimise Powerwall for maximum savings.

Connect with your Certified Installer about your home's needs.

Please note that savings can vary and are not guaranteed.
